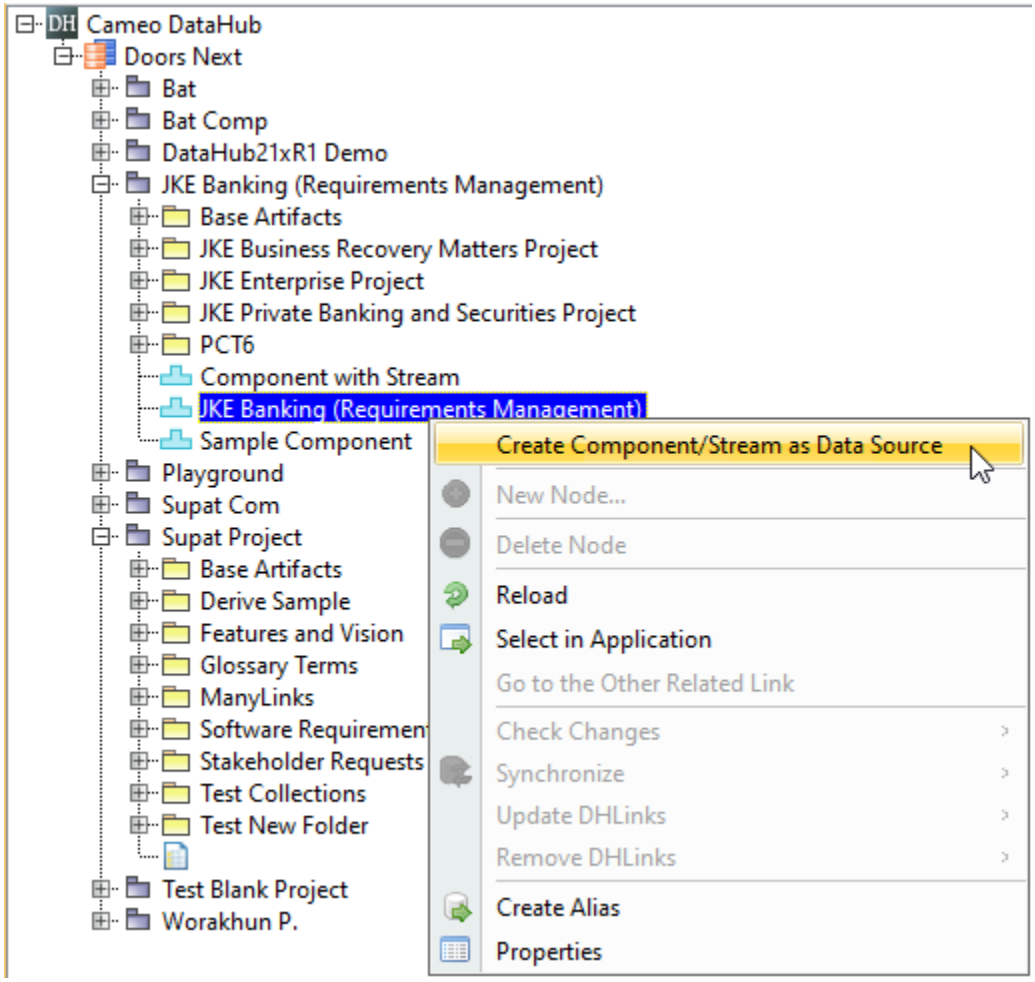
Components or Streams in DOORS Next Generation

You can now work with a Component or Stream by creating a new Data Source from it so that DOORS Next Generation projects can be connected to specific Components/Streams.

To create a Component/Stream Data Source

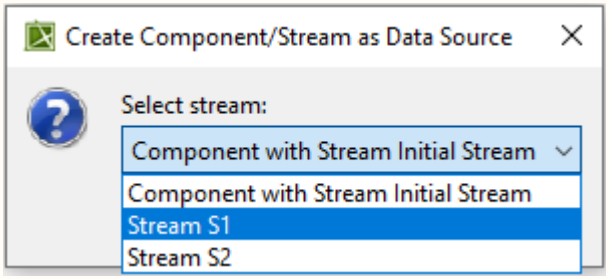
- Right-click a Component element in DataHub Explorer and select **Create Component/Stream as Data Source**.



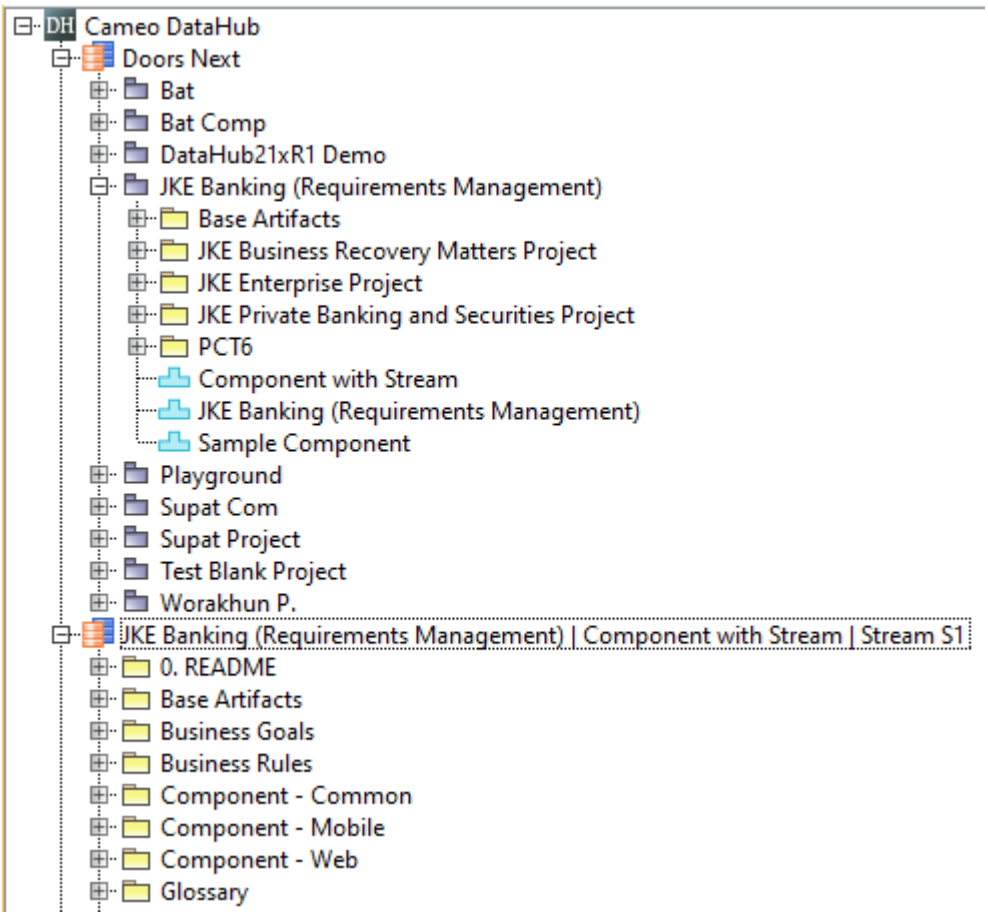
The Create Component/Stream as Data Source command.

Note

- An Initial Stream is used when creating a Data Source for a Component without an additional Stream.
- If the Component with Stream(s) other than the Initial Stream is selected, the **Select stream** list in the **Create Component/Stream as Data Source** dialog will appear.



The Select stream list in the Create Component/Stream as Data Source dialog.



The created Component/Stream Data Source.

Information

The Component/Stream Data Source name is represented in the format of *<Project Area name>* | *<Component name>* | *<Stream name>*.
