

Validation

Validation checks the accuracy and compatibility of the added Data Markings, displays errors in the model, and suggests solutions. The validation suites are part of the [Data Markings Profile](#). In order for the validation rules to work in your project, the Data Markings Profile must be part of your project.

The Data Markings and Classification Plugin provides two Data Markings validation suites to validate the Data Markings used in the model:

- **Data Markings**
Passive validation suite. You can view the validation rules in this suite on the [Data Markings validation rules](#) page.
- **Data Markings (Auto)**
Active validation suite. You can view the validation rules in this suite on the [Data Markings active validation rules](#) page.
