Equivalent properties

The Concept Modeler allows you to represent, import, and export equivalent properties in a model. You can make two or more properties equivalent to each other by applying the stereotype **«Equivalent Property»** to the target property and the tagged value "**equivalent to**" the equivalent property.
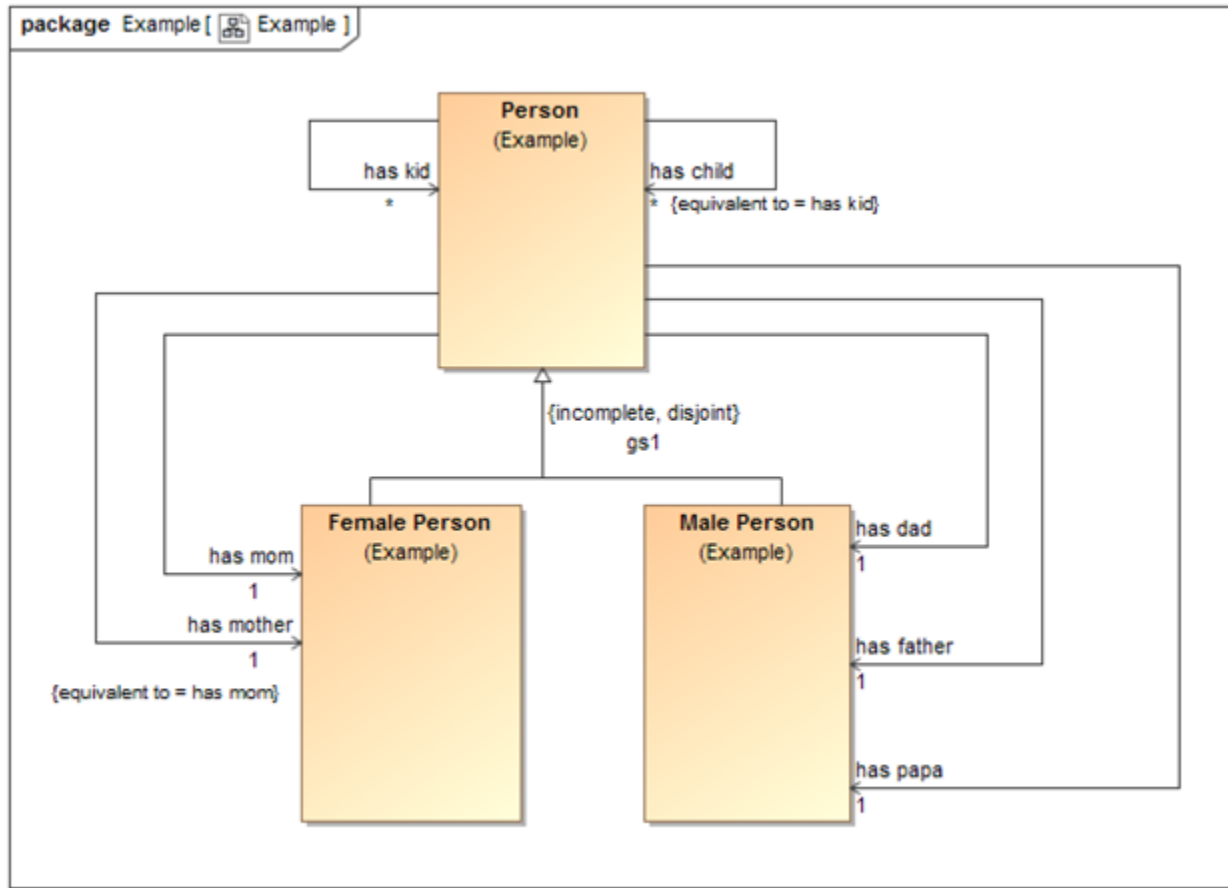

> ⚠ **Note**
> - An existential or universal quantification restriction *cannot* have or be an equivalent property, although the property it restricts *can*.
> - A sub-property *can* have or be an equivalent property.

The following figure shows the equivalent properties in a diagram.

Equivalent properties in Concept Modeler.

In the example, the property "has mother" is equivalent to the property "has mom". For more information on how to create equivalent properties, see Creating equivalent properties.
