

What's New in UPDM Plugin 18.3 FR

Released on: February 1, 2016

New! UPDM 3 Plugin (Technology Preview)

UPDM 3 Standard Support (Technology Preview)

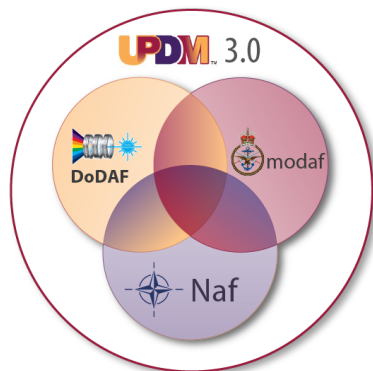

It's our pleasure to introduce UPDM 3 Plugin (Technology Preview) that is based on the upcoming UPDM 3 (UAFP) standard! Modeling is less confusing and much quicker because of consistency between concepts, definitions, and semantics.

Modeling is much more efficient in UPDM 3 plugin because you can:

- Collaborate with architects that use different but consistent frameworks easily.
- Operate the Security concepts freely, which allows you to extend the model by defining Security elements.
- Enjoy tight integration with SysML that allows extending UPDM models by defining SysML elements and diagrams.
- Ensure the role of the human along with the hardware and software while engineering a system with Human Systems Integration (HSI) support.
- Use all artifacts and model elements that are based on UPDM 3 (UAFP) standard easily.
- Automatically migrate from UPDM 2.0 to UPDM 3.0. Please refer to [Migration Guide to UPDM 3.0](#).
- Smoothly go through samples and quickly access documentation. Please refer to [UPDM 3 Plugin Documentation](#).

You're welcome to try UPDM 3 Plugin by importing it in Cameo Enterprise Architecture product! Pay attention that you can use only one UPDM plugin at once: UPDM 2 or UPDM 3.

UPDM 2 Plugin

Easier Swimlane Manipulation

You no longer need to turn your focus away from Activity diagrams when you want to create represented elements. A new smart manipulator button and a shortcut menu command allow you to create Performers or system resources by simply clicking the Partition header to access the **Create Represented Elements** button.
