

Understanding DataHub user interface

This chapter is an introduction to the various elements of the DataHub User Interface, menus, dialogs, context menus, tabs and panels.

Cameo DataHub allows you to work with requirement management tools such as IBM® Rational® DOORS®, IBM® Rational® DOORS® Next Generation, and MagicDraw®. The DataHub also allows you to copy and synchronize Requirements. DHLink links Requirements to one another and also links Requirements to system design models and test cases.

DataHub provides unidirectional or bidirectional synchronization capabilities between target and source nodes. A synchronization Conflict Dashboard shows the sync status and options for additional synchronization.

Before using DataHub to connect with IBM® Rational® DOORS®, you must first [deploy the DOORS driver](#).
