Authentication server

Teamwork Cloud authentication server is built to facilitate authentication service. Applications can validate and authenticate entities (such as remote users or nodes) that attempt to access the network using account names and passwords.

Authentication server can also create external users in the Teamwork Cloud system once they have been validated successfully. You can allow the authentication server and the LDAP server to do this using Teamwork Cloud Admin's Server Settings page.

• This section provides the configuration parameters of Authentication server. You can find these parameters in Teamwork Cloud <install_root>

hentication server installation has changed since earlier versions. Now, Authentication server is placed under the Web Application Platform and thus

no longervions-aspasseparate service

The following sections provide instructions on how to install and configure the authentication server in Teamwork Cloud.

- Authentication server installation and upgrade
- Integrating authentication server with ForgeRock
- Managing HTTPS and SSL on server
- SAML integration
- Common Access Card
- · Disabling authentication with username and password
