

Disabling authentication with username and password

You can disable authentication with a username and password as described below.

This feature affects only the logins using the Authentication server, such as logging into Teamwork Cloud from web applications and from a modeling tool using SSO.

To disable authentication with a username and password

1. Go to the `<install_root>\WebAppPlatform\shared\conf` directory and open the **authserver.properties** file.
 2. In the file, find the **authentication.disable.credentials** property and change its value to *true*.
 3. Restart the webapp service.
