License management

This section explains everything you need to know to activate and/or update the license required to access and use the features of the Teamwork Cloud system. After installing Teamwork Cloud on either a single or cluster server, you need to first install a FlexNet License Server before activating the Teamwork Cloud license. Teamwork Cloud uses the FlexNet License server to protect its licenses and help manage the number of Teamwork Cloud licenses used by concurrent clients. You need to import a floating license key of Teamwork Cloud to the FlexNet License Server before you can activate it from the Teamwork Cloud Admin.

The following link provides the instructions to install, set up, as well as upgrade your FlexNet license server.

Once you have applied the Teamwork Cloud license, you can start working with Teamwork Cloud.

The following sections provide instructions on license management:

- Applying a Teamwork Cloud license
- Changing a Teamwork Cloud license
- License access configuration – information on applying a Cameo Collaborator license
