

Available report types

There are 5 types of reports available in the Reports application:

- The **User details** report allows you to export user data, such as their full name, phone number, or email. Also, you can choose to export user permissions, which is helpful for user audit purposes.
- The **Resource access** report shows a timeline of selected users who have accessed various resources in a given time frame.
- The **Resource modifications** report is a list of users who have modified resources in a given time frame with all essential information, such as the commit message.
- The **Failed login attempts** report is self-explanatory; it shows all failed logins. This is an essential report for IT administrators who audit server security.
- Finally, the **Audit report** is a list of users' actions related to resources. Exported data shows which users were granted or lost access to a resource, the time of the action, and who performed it.
