

Adding a value to a global variable

A global variable is a variable that is accessible from any session in the same execution. You can use ALH API to create a global variable and specify its value by calling `ALH.setGlobalVariable(String variableName, Object value)`.

```
void setGlobalVariable(String variableName, Object value)
```

The code example is as follows

```
ALH.setGlobalVariable("GLOBAL_COUNT", 1);
```

The example code assigns 1 to a global variable named `GLOBAL_COUNT`. If the global variable with the given name does not exist, this method will create a new global variable with the same name and add the value to it.
