

Users application

This section contains the information needed for managing Teamwork Cloud users and user groups.

The **User** is usually created to work on authorized resources via modeling tool. There are two categories of users in the Teamwork Cloud system: internal and external.

- **Internal users** are originally created in Teamwork Cloud Admin and therefore their usernames, passwords, and other data are stored in Teamwork Cloud.
- **External users** are from LDAP servers who were imported into the Teamwork Cloud system or SAML users who passed the [authentication process](#) and were automatically created as external users in Teamwork Cloud.

The **User group** is used to group users, assigning the same role to all users in the same group. You can manage both internal and external groups.
