

# Specifying a structural feature value

You can use the following API to specify a structural feature value:

```
void setValue(StructuredValue object, String featureName, Object value)
```

The following example shows how to specify the value of the structural feature in ALH API:

```
value = ALH.setValue(object, "speed", "10");
```

If the value of an object or a featureName is null, an IllegalArgumentException will be thrown. However, null is acceptable for an assigned value.

In addition, the RuntimeObject can be omitted. The following example shows how to set a structural feature value without specifying a RuntimeObject in ALH API:

```
void setValue(String featureName, Object value)
```

## Information

Alternatively, you can use ALH API through the fUML object syntax, with **object.setValue(featureName, value)**. For example:

- `value = object.setValue("speed", "10");`
