Calling operations from the model

On this page

- Built-in operations
- Creating executable opaque behaviors

In a structured expression, you can call an operation defined in the model. An operation from the model can be either built-in or custom. The built-in operations, such as Union, Find, or Filter, are stored as executable opaque behaviors in the *Built-In Operations* package, which is owned by *UML Standard* Profile::MagicDraw Profile.

Type the name representing the model element you are searching for and select matches found in the Tree or List view. For an advanced search, use the exact match, camel case, or wildcards (*,?). You can also apply a filter to narrow down the search scope.	Select Opaque Behavior	×
