# Exporting models and concept models at any level in package hierarchy

Magic Concept Modeler can export «Model» and «Concept Model» stereotyped packages at any level under a package hierarchy by right-clicking any package in the hierarchy. The selected package(s) and their sub-packages that are «Model» or «Concept Model» stereotyped will be exported.

To export the selected package(s) and their sub-packages that are «Model» or «Concept Model» stereotyped

1. Select one or more packages (by holding **CTRL** when selecting other packages) to export. Right-click one of the selected packages and select **Export Model to OWL**.

2. In the Browse dialog, specify the export location.
3. Click **Open**. The **fileExportPath** tag value will be updated, and the selected package(s) and their sub-packages that are «Model» or «Concept Model» stereotyped will be exported.

> ⚠️ **Note**
> For server projects, you must lock the package(s) first to update tag value.

> ⚠️ **Failure in Bulk Exporting**
> A failure in multi-package bulk export to OWL now does not cancel exporting all the remaining packages.

> ⚠️ **Canceling Bulk Exporting**
> Clicking Cancel for bulk export to OWL operation also cancels the export of all the Packages.
