

# Using server project file format

To ensure faster project export and import while retaining the same project structure, you can use the file exchange format `.szip`. Using this format, you can export a project with or without used projects, add a project as a new server project, and update it from a locally saved server project file.

You cannot open server project files locally. To view the contents of a project, you must add the project or update it using the `.szip` file.
