

Configuring email notifications for services

Web Application Platform services can generate email notifications and send them to a remote email system. To enable email notifications, configure Web Application Platform services, as described below.

To enable email notifications

1. Go to the `<install_root>/WebAppPlatform/shared/conf` directory.
2. Open for editing the `webappplatform.properties` file.

In the `webappplatform.properties` file:

- The values of some properties are placeholders, e.g., **mail.from.default=info@company.com**. Make sure to replace the placeholders with actual values.
- Read the comments with property descriptions to ensure accuracy when specifying property values.

3. Specify the properties under the *Platform mailing engine properties used to send notifications via e-mail* property group.
4. If the email server uses SSL or TLS, specify the properties under the *Mailing engine TLS secure properties* property group. Otherwise, go to the next step.
5. Restart Web Application Platform.
