# Simulation in the Resources application

You can simulate server projects with specified UI in the Resources application of Teamwork Cloud.
To simulate a project in the Resources application

1. Open the Resources application and navigate to the project you want to simulate.
2. Click ⋮ on the right side of the project line and select **Run simulation**.

⚠️ You can only run a project with a UI mockup or Time Series chart. If the project has no specified UI, the **Run simulation** menu item is not available. For more information on how to prepare projects with UI for simulation, refer to Simulation with UI.

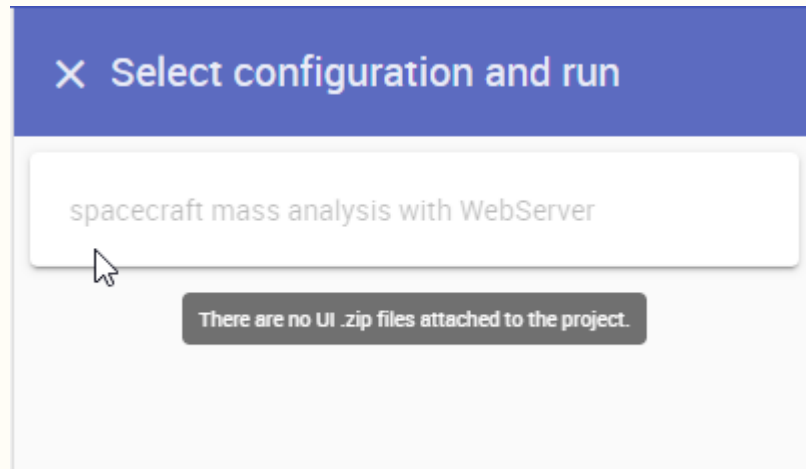

3. On the right-side pane select the simulation configuration you want to run and click ▶.

⚠️

> ⚠️ If the name of a Simulation Configuration is greyed out and you cannot select it, it means that the project has a UI but it is not generated and attached to the project. In this case, generate and attach HTML to the Teamwork Cloud project.
>
>
>
> ✕ Select configuration and run
>
> spacecraft mass analysis with WebServer
>
> There are no UI .zip files attached to the project.

After completing the above steps, you should get a notification that the simulation has been started successfully.
