

Introduction to Cameo Simulation Toolkit

Cameo Simulation Toolkit provides the first in the industry extendable model execution framework based on OMG fUML and W3C SCXML standards. It extends UPDM plugin to validate system behavior by executing, animating, and debugging SysML Parametric models in the context of realistic mock-ups of the intended user interface.

Why Simulation?

The purpose of a simulation is to gain system understanding without manipulating the real system, either because it is not yet defined or available, or because it cannot be exercised directly due to cost, time, resources or risk constraints. Simulation is typically performed on a model of the system.

With the Cameo Simulation Toolkit, users can test how the system reacts to user interaction or predefined testing data and execution scenarios.

Business Benefits

Users will find that one of the key business benefits of the Cameo Simulation Toolkit is cost efficiency. Employing Cameo Simulation Toolkit will assist enterprises in significantly reducing project costs, allowing users to identify design errors before the actual production of components.
