

UPDM 2.1 migration to UAF 1.1

UAF definition

The Unified Profile for DoDAF and MODAF (UAF) is the standard of an Object Management Group (OMG) initiative to develop a modeling standard that supports both the US Department of Defense Architecture Framework (DoDAF) and UK Ministry of Defense Architecture Framework (MODAF).

The purpose of UAF migration

The purpose of UAF migration to the latest UAF specification version is to convert earlier UAF versions metamodel-based projects into the latest UAF version metamodel-based projects without losing data.

Migration back to earlier UAF versions is not possible, so we highly recommend you to back-up your current UAF projects before proceeding with migration to the latest UAF version.

The purpose of the migration guide

The purpose of this guide is to help you to understand the differences between UAF specifications and guide you along the data mapping process.

This manual describes the data mapping process while migrating from UPDM 2.1 to UAF 1.1.
