

Operational Event Trace

Description

MODAF/NAF: An `OperationalEventTrace` (`MODAF::OperationalInteractionSpecification`, `NAF::OperationalInteractionSpecification`) is a specification of the interactions between nodes in an operational architecture.

DoDAF: The Operational Event-Trace Description (OV-6c) DoDAF- described View provides a time ordered examination of the resource flows as a result of a particular scenario. Each event- trace diagram will have an accompanying description that defines the particular scenario or situation.
