

Getting Started with Teamwork Server

Teamwork Server makes it easy to exchange data directly in the context of your work. It provides a central repository for storing any kind of models. Using Teamwork Server, team members can access, review, or modify the same model or even the same diagram at the same time. It supports importing, exporting, updating, branching or comparing in-server-stored models.

Server data and configuration can be managed through a separate administrative console with a minimal technical knowledge and effort.
