

Conditional Boundary Event

Description

A Conditional Boundary Event is triggered when a specified condition becomes true. When the event is triggered, it will change a normal flow of a Process into an exception flow.

This event displays either of the following on a diagram:

- A Conditional Catching Intermediate Event name if the name is specified.
- A Conditional property value if the name is unspecified.

Notation

- Conditional Boundary Event (Cancel Activity - True)

- Non-interrupting Conditional Boundary Event (Cancel Activity - True)
