

Migrating data from a previous version of DataHub

- [Migrating data in DataHub 17.0.2 - 18.0](#)
- [Migrating data in DataHub 18.1 - 18.5](#)

The current release of DataHub does not support data migration for Cameo Requirements+ and MagicRQ plugin Data Sources. The current release only supports data migration from DOORS and CSV Data Sources to MagicDraw® and vice versa. Either the source or target must be a MagicDraw® Data Source.

Migrating data in DataHub 17.0.2 - 18.0

If you have created data in DataHub 17.0.2 to 18.0, you must migrate it to the 18.4 version using the **Migrate DataHub** menu item.

To migrate data in DataHub 17.0.2 - 18.0

1. Open a MagicDraw project. This can be a local or Teamwork project.
2. From the MagicDraw main menu, click **Tools > DataHub > DataHub Explorer**. Add all the Data Sources you want to migrate and connect them.
3. From the MagicDraw main menu, click **Tools > DataHub > Migrate DataHub**. The **Cameo DataHub Migration** dialog opens.

4. Choose either the **Select DataHub version to migrate** or **Select DataHub data folder to migrate** option.

Information

- If you choose the **Select DataHub version to migrate** option, select the DataHub version to migrate from the list.
- If you choose the **Select DataHub data folder to migrate** option, click **Browse** to locate the DataHub directory. On Windows, the DataHub directory is `C:\Users\userdirectory\datahub`. On Linux, the DataHub directory is `/home/userdirectory/.datahub`.

5. Click **Migrate** in the **Cameo DataHub Migration** dialog. The **DHLink** from the older version of DataHub will be migrated to the current DataHub version.

Migrating data in DataHub 18.1 - 18.5

If you have created data in DataHub 18.1 to 18.5, the data must be migrated to 19.0. The migration to the 19.0 version is performed automatically after DataHub Explorer is open.

Important

- The migration to the 19.0 version is performed only on the open project (main project).
- If the used project also contains the **DataHub_Data** package, you must open the used project to allow it to migrate to the 19.0 version.

Data in the Containment tree before migrating from the 18.5 to 19.0 version.

Data zipped in the Containment tree after migrating from the 18.5 to 19.0 version.

i Information

- **Scope sync** relations from the previous DataHub version will be migrated to **Synchronized DHLink**.
- **Sync Auto** and **Sync Manual** relations remain the same.
- Trace relations from the previous DataHub version will be migrated as **DHTrace**.
