

Creating a concept modeling project

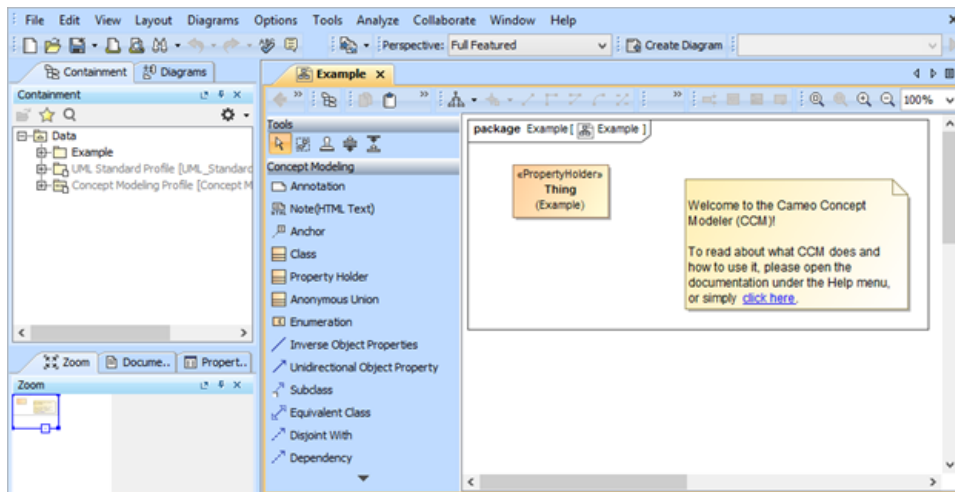

To create a concept modeling project

1. Click **File > New Project**. The **New Project** dialog will open.
2. Select **Concept Modeling Project**.
3. Name your project and select your **Project location**.

Selecting the Concept Modeling profile.

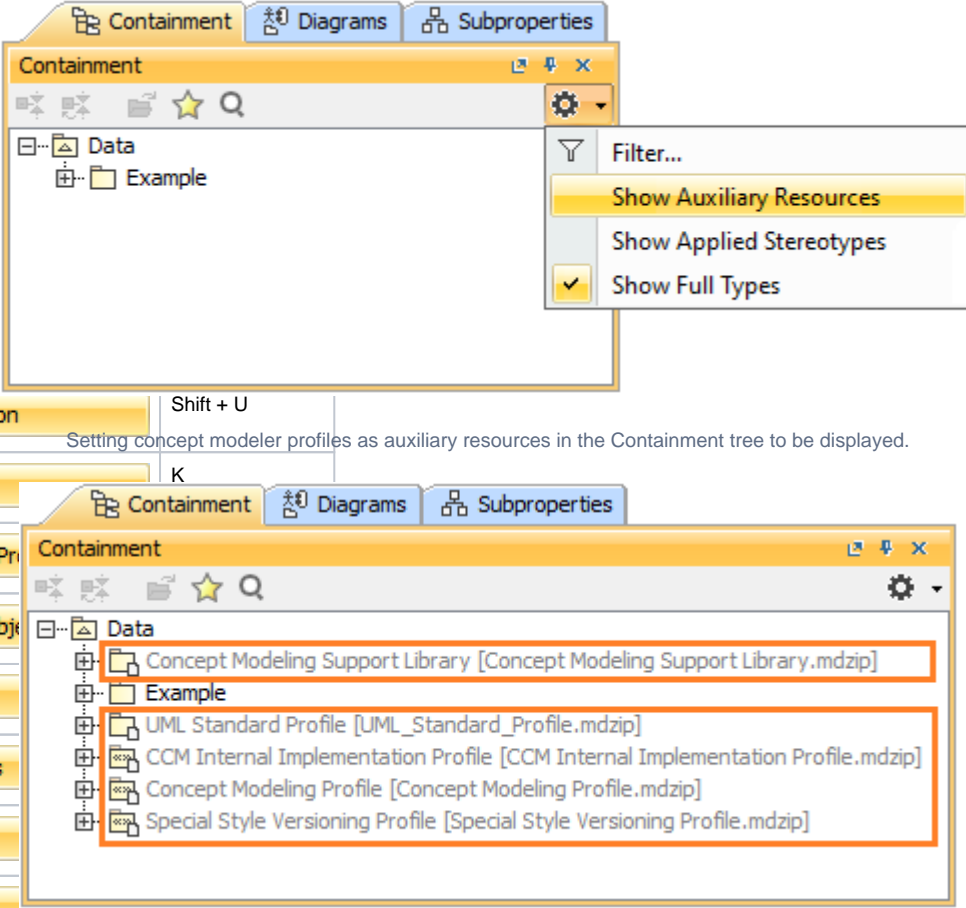

4. Click **OK**. A new Concept Modeling diagram will open, complete with the Concept Modeling diagram palette. This diagram and its palette will also open whenever you create a new Concept Modeling diagram.

The Concept Modeling diagram and its palette.

You can display or hide concept modeler profiles as auxiliary resources in the Containment tree by clicking  and selecting **Show Auxiliary Resources**. The following table shows the buttons in the Concept Modeling diagram palette, which represent the elements you use to create a Concept Modeling diagram. You can drag the button to a diagram to create that kind of element. The shortcut key may also make it easier for you to create a specific element.

| Button | Shortcut Key |
|--|--------------|
|  Annotation | |
|  Note(HTML Text) | |
|  Anchor | |
|  Class | |
|  Property Holder | |
|  Anonymous Union | Shift + U |
|  Enumeration | K |
|  Inverse Object Property | |
|  Unidirectional Object Property | |
|  Subclass | |
|  Equivalent Class | |
|  Disjoint With | |
|  Dependency | |

Setting concept modeler profiles as auxiliary resources in the Containment tree to be displayed.

Concept modeler auxiliary resources in the Containment tree are displayed in grey.

If you use either **Inverse Object Properties** or **Unidirectional Object Property**, the following items will be created:

- When a property's type does not have a name, "*unnamed property*" will be used as the property's name.
- When a property's type has a name, the name will be written in lower-case letters and recognized with "*has*" (with a space after). For example, if the property's type name is "*Boss Deck*", it will be converted to "*has boss deck*".
