Package permissions

By default, all packages in the project can be reviewed and modified by any Teamwork Cloud user.

There are two levels of permissions:

- The Global permission specifies which permission is applied for all project packages for all users:
 Select Read-Write as the Global permission to allow editing of the entire model.
 - Select Read-Only as the Global permission to restrict editing of the entire model.

Gobal permissions can be overridden by package permissions:

Package permissions specify the permissions applied to a particular package with Read-Write permission. This allows the user/group to edit the package, the global permission is specified for the package, the global permission is specified for the package.

If you want to restrict editing of a package for a specific user or user group, you can easily do this by modifying the package permissions. You can modify package permissions if you have the user/group from editing the package permission on that project. Select:

- package, whereas editing the rest of the model is allowed.
 Read-Only to restrict editing of the package for the selected user.
- Read-Write to allow editing of the package for the selected user.

By default, Read-Write as the Global permission is assigned to the project and the Read-Only permission is assigned to the package.

Reproject-level and package-level permissions an be overridden by package permissions. For example, if a user was granted project-level Read-

Write permissions, but was assigned **Read-Only** permissions for a particular package, that user will not be allowed to make changes to the elements ow **Related** pages ackage and the package itself.

usen kasoprojeon ever Realizonty participasions, package permissions cannot override them.
