

Specifying a structural feature value

You can use the following API to specify a structural feature value:

```
public static void setValue(StructuredValue object, String featureName, Object value) {  
    ...  
}
```

The following example shows how to specify the value of the structural feature in ALH API:

```
value = ALH.setValue(object, "speed", "10");
```

If the value of an object or a featureName is null, an `IllegalArgumentException` will be thrown. However, null is acceptable for an assigned value.

In addition, the `RuntimeObject` can be omitted. The following example shows how to set a structural feature value without specifying a `RuntimeObject` in ALH API:

```
public static void setValue(String featureName, Object value) {  
    ...  
}
```
