UPDM migration manual

The purpose of this manual is to help you understanding differences between UPDM specifications and guide you along the data mapping process.

The following chapters describe how the migration works.

- UPDM 2.0 Migration to UPDM 2.1
- UPDM 1.x Migration to UPDM 2.0

Basic Concepts and Instructions

The Unified Profile for DoDAF/MODAF (UPDM) is the standard of an Object Management Group (OMG) initiative to develop a modeling standard that supports both the US Department of Defense Architecture Framework (DoDAF) and UK Ministry of Defense Architecture Framework (MODAF).

The purpose of UPDM migration to the latest UPDM specification version is to convert earlier UPDM versions metamodel-based projects into the latest UPDM version metamodel-based projects without losing data.

A migration back to earlier UPDM versions is not possible, so we highly recommend you to back-up your current UPDM projects before proceeding with migration to the latest UPDM version.
