

Tracking deprecated requirements

Suspect links analysis allows tracking deprecated requirements. This is useful when you are working with requirements and some of them are no longer used. In that case, apply the «*deprecated*» stereotype to mark the requirements of this type.

Deprecated requirements are tracked by default.

All deprecated requirements are provided in the **Validation Results** panel.

The screenshot shows the 'Validation Results' panel with a table of validation messages. The table has columns: Element, Severity, Abbreviation, Message, and Is Ignored. One message is listed: Element 'SR4 ACC Brake' with Severity 'warning', Abbreviation 'SusDprElement', Message 'The element is deprecated.', and Is Ignored 'Not Ignored'.

Element	Severity	Abbreviation	Message	Is Ignored
Suspect Links SR4 ACC Brake	warning	SusDprElement	The element is deprecated.	Not Ignored

To check whether deprecated requirements are tracked

- In the main toolbar, go to **Analyze > Suspect Links** and select **Options**. If the check box next to the **Track Deprecated Elements** property group is checked and set to *true*, tracking deprecated elements is enabled.
