

Moving elements to other projects

You can move the selected elements from the main server project to a [directly used project](#). The relations are also moved with the element(s).

Moving cannot be undone

The action cannot be undone as a new version is created and committed to the Teamwork Cloud server automatically after selected elements are moved to a new location.

To move elements from the main server project to a used one

1. In the Model Browser, select one or more elements.
2. Right-click the selected elements and, from the shortcut menu, choose **Refactor > Move Element(s) to Other Project**.
3. The **Move Elements** dialog opens. Select a used project or a package in a used project where you want to move the elements.

Drag the selection

You can drag and drop the selected elements to the used project instead of using the shortcut menu.

4. Do one of the following:
 - Click **Move** to start moving elements or
 - click **Select More** to specify your selection. The **Select Elements** dialog elements opens, wherein you can:
 - add or remove some elements from selection or
 - change the destination package (click  at the end of the row).

Click **OK** when you are done.
5. The question appears, if you want to [check dependencies among projects](#). Select **Yes/No** to continue moving elements.
6. After elements are moved, a new server project version is created and committed to the server automatically.
