Importing annotations on an OWL ontology to a concept model

An OWL ontology may have one or more annotations added to itself. Concept Modeler can import the annotations as annotations on a concept model. If there is only one annotation on the OWL ontology, it will show u p in the concept model's Documentation pane in MagicDraw upon import. When there are more than one annotations imported, they will not show up automatically in the Documentation pane. You need to specify which one gets to be displayed as the package's default documentation by selecting it from the Preferred annotation property option in the Project Options dialog. The rest of the annotations will become the package owned comments (UML comments tagged as Annotation).
