

Users Application

This section contains the information needed for managing Teamwork Cloud users and user groups.

User is usually created to work on authorized resources via No Magic modeling tool. There are two categories of users in the TWCloud system: internal and external.

- **Internal users** are originally created in Teamwork Cloud Admin and therefore their usernames, passwords, and other data are stored in TWCloud.
- **External users** are from LDAP servers who were imported into the TWCloud system or SAML users who passed the [authentication process](#) and were automatically created as external users in TWCloud.

The **User group** is used to group users, assigning the same role to all users in the same group. You can manage both internal and external groups.
