

Copying data with custom types and properties

Elements in the source and the target data normally contain different sets of attributes. To have matching attributes when copying data across tools, you need to prepare custom attributes for the target types before copying data so that new custom attributes are available during data copying.

To prepare custom attributes for Requirement elements in MagicDraw®

1. Create a new Stereotype, e.g., <<*doors_attr*>>.
2. Add properties to <<*doors_attr*>>, e.g., *Custom1* and *Custom2*. These properties are custom attributes.
3. Create a Requirement element.
4. Right-click the created Requirement element and select **Stereotype**.
5. Search for <<**doors_attr**>> and select the stereotype. The custom data type is now ready for DataHub. This data type is available for you to select in the **Copy Data** dialog.

When you select this data type as the target type, the custom attributes, *Custom1* and *Custom2*, are available.
