

Equivalent properties

The Concept Modeler allows you to represent, import, and export equivalent properties in a model. You can make two or more properties equivalent to each other by applying the stereotype «**Equivalent Property**» to the target property and the tagged value “**equivalent to**” the equivalent property.

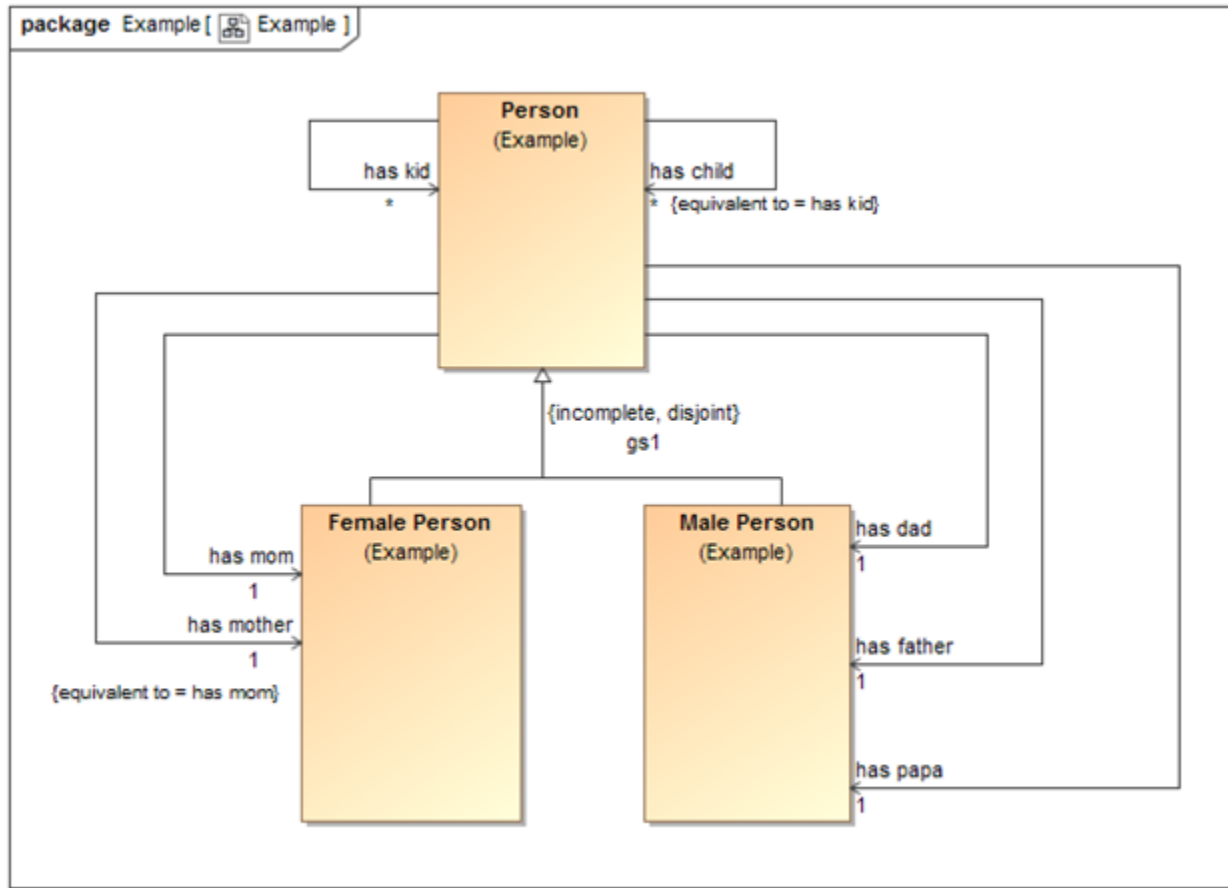

Note

- An existential or universal quantification restriction *cannot* have or be an equivalent property, although the property it restricts *can*.

- A sub-property *can* have or be an equivalent property.

The following figure shows the equivalent properties in a diagram.

Equivalent properties in Concept Modeler.

In the example, the property “has mother” is equivalent to the property “has mom”. For more information on how to create equivalent properties, see [Creating equivalent properties](#).
