

Specifying IRI ontology versions

An ontology may have an ontology IRI, the ontology's identifier. The ontology may or may not also have a **versionIRI**, the ontology's version identifier.

To specify an IRI ontology version to an exported concept model

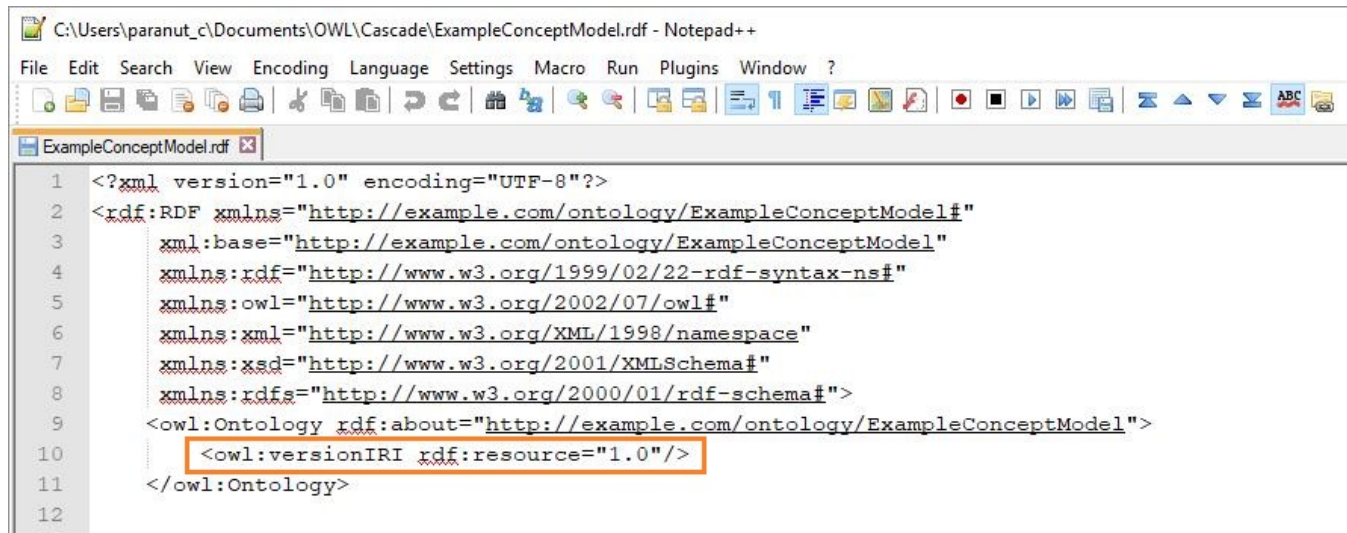

1. Right-click a concept model you want to export and select **Specification**. The Specification window opens.
2. On the left pane, select **Tags**.
3. In the tree structure, do one of the following

- Double-click **versionIRI**.
- Select **versionIRI** and click **Create Value**.

4. The **Value** box appears on the right side of the dialog.
5. In the **Value** box, specify the version for the exported concept model.
6. Click **Close**.

After you export the concept model, the **versionIRI** tag is displayed in the exported ontology file to show the version number.

The versionIRI tag is displayed in the RDF file.
