Using To Do property

Going through the above sections of the manual, you have probably noticed that a large number of element properties were marked "added to the To Do property". It indicates that data which cannot be directly mapped or has been removed during migration is placed in the element's To Do property.

To find all elements which contain information in the To Do property

1. From the main toolbar click **Edit** > **Find TODO**.
   All elements which contain information in the To Do property are listed in the **Search Results** tab.

For example, if you had Desired Effect relation connected to State *Searching (Aircraft)* before the migration, the information about it is stored in the To Do property of Capability *Search* (source of the relationship).
