

XML schema namespaces

Maps to a UML Package with the stereotype `XSDnamespace`. To define the “`xmlns`” attribute in the schema file, you must add Permission between the `XSDnamespace` package and `XSDschema` class into the model.

- The Permission name maps to the namespace shortcut.

XML representation of the skeleton of a schema

```
<xs:schema  
    xmlns:xs="http://www.w3.org/2001/XMLSchema" xmlns="http://www.w3.org/2001/XMLSchema"  
    targetNamespace="http://www.example.com/example">  
    ...  
</xs:schema>
```

To generate these namespaces

- The UML model must have a Package with the name `http://www.w3.org/2001/XMLSchema`
- The UML model must have a Package with the name `http://www.example.com/example`
- Permission with the name “`xs`” must be added into the model between the `XMLSchema` Class and the Package `http://www.w3.org/2001/XMLSchema`
- Permission without a name must be added into the model between the `XMLSchema` Class and the Package `http://www.w3.org/2001/XMLSchema`

For an XML schema namespaces UML Model example, see [Schema](#).
