Creating merged row vertically

There are two methods that you can use to merge rows.

\$tableprop.mergeRows(Int number)

When you put the statement into a row, it will be set as a merged row in a specified number.

For example:

Template code:

#forrow(\$c in	
\$sorter.sort(\$Class))\$c.name\$tableprop.mergeRows(\$c.ownedElement.size())#set(\$count=0)	\$attr.name#if(\$count < \$c.ownedElement.size())
#foreach(\$attr in \$c.ownedElement)#set(\$count = \$count + 1)	
#end#if(false)	#end#end#endrow

Output:

ClassA	Att1
	Att2
	Att3
ClassB	Att1

\$tableprop.mergeRows(String stringNumber)

When you put the statement into a row, it will be set as a merged row in a specified String of number. For example:

Template code:

Output:

Name	Α
	В
	С

mergeRows merges only existing cells in the same column and does not increase the number of rows or cells.

For example:

Template code:

#forrow(\$package in \$Package)	\$package.name#endrow
\$tableprop.mergeRows("5")Package	

In case there are three packages, the output will be:

Package	Package1
	Package2
	Package3
