Working with custom document templates

When configuring settings for publishing a model to Cameo Collaborator, you must choose a template to determine the appearance and content of a published document. If predefined templates do not meet your specific needs, you can create and apply a custom template. In custom templates, you can specify which model elements are published, what element information is displayed, and the format in which it is displayed. A custom template can be stored within a model itself or as a separate .mdzip file, which allows you to reuse it multiple models. The following topics will help you learn how to modify a predefined template or create your own template from scratch:

- Creating a custom template
- Using a custom template in a model
- Customizing the appearance of a project portal
- Enabling the Document View
- Enabling the Single Tree View
