License management

This section explains everything you need to know to activate and/or update the license required to access and use the features of the Teamwork Cloud (TWCloud) system. After installing TWCloud on either a single or cluster server, you need to first install a FlexNet License Server before activating the TWCloud license. TWCloud uses the FlexNet License server to protect its licenses and help manage the number of TWCloud licenses used by concurrent clients. You need to import a floating license key of TWCloud to the FlexNet License Server before you can activate it from the Teamwork Cloud Admin (TWCloud Admin).

The following link provides the instructions to install, set up, as well as upgrade your FlexNet license server.

Once you have applied the TWCloud license, you can start working with TWCloud.

The following sections provide instructions on license management.

- Applying a TWCloud license
- Changing a TWCloud license
