# MODAF. StV-2 Capability Taxonomy

Description

The view presents a hierarchy of capabilities. These capabilities may be presented in context of an Enterprise Phase, i.e. it can show the required capabilities for current and future enterprises. The StV-2 specifies all the capabilities that are reference throughout one or more architectures. In addition it can be used as a source document for the development of high-level use cases and Key User Requirements (KUR). The StV-2 also provides metrics against each capability that may be used to measure successfully fielded capability.

Implementation

StV-2 can be represented using a StV-2 diagram which is based on the UML Class diagram.

> ⚠ If your project has migrated from any earlier than 17.0.1 version, the old StV-5 View representation based on the UML Class diagram is loaded as the StV-2 Capability Taxonomy diagram.
