## Calling operations from the model

On this page

- Built-in operations
- Creating executable opaque behaviors

In a structured expression, you can call an operation defined in the model. An operation from the model can be either built-in or custom. The built-in operations, such as Union, Find, or Filter, are stored as executable opaque behaviors in the *Built-In Operations* package, which is owned by *UML Standard Profile::MagicDraw Profile.* 

Select Opaque Behavior
Select, search for, or create an element Use the List or Tree view to search for an element. To find the element, type a name in the "Search by Name" box. You can also use wildcards (*,?). Click the magnifier icon to select searching for elements by qualified names, or use camel case.
