

Removing users from user groups

You can remove users from user groups in the Users application. After removing a user from a user group, they lose all permissions of the roles assigned to that user group.

To remove a user from a user group

1. Go to the Users application and select **User groups** in the user/user group filter on the left side of the screen.
2. In the content pane, select the user group you want to remove a user from.
3. When the **User group** pane opens, click the change button in the **Group members** card.

4. When the **Change group members** pane opens, click  next to the name of the user you want to remove.

Finding users

If the group has a lot of users, select the **Search member** radio button and type the user name in the search bar to find the user you need.
