19.0 LTR SP4 Version News

Released on: June 30, 2020

Key Issues Fixed in this Service Pack

The following issues have been fixed with this version:

- The SAML integration with metadata URL did not work with IdP under a secure connection.
- The internal server error used to appear in certain cases when querying the decomposition of the UML model via REST API.
- The possible unsuccessful import of LDAP user groups was resolved by providing a separate user group class configuration.
- The number of open files issue was fixed in the TWCloud service script.
- The default *eobject-id-for-revision.cache-size* parameter in the TWCloud configuration file was lowered to 30 in order to prevent the out of memory exceptions when under a higher load.
- The duplicate active users exception no longer appears upon the "Administrator" user removal via Data Manager.
