

Execution Environment

An Execution Environment is a type of node that defines a set of services that support software. For example, an execution environment in the processor on a server might provide the operating system-level services needed to support a database application installed in that environment. Some typical stereotypes for an execution environment include `<OS>`, `<workflow engine>`, `<database system>`, and `<J2EE container>`.

Specify the Execution Environment element in the Execution Environment [Specification window](#).

The Execution Environment dialog box contains the following specific panes:

- Nested Nodes: lists nodes defined (nested) in the Execution Environment.
- Deployed Artifacts: an artifact or artifact instance that has been deployed to a deployment target.

You can format the Execution Environment symbol properties in the [Symbol Properties dialog](#).
