Creating Profiles

Profiles can be created in any project. However, often many projects use the same profiles. In order to reuse the same profile, it must be created as an independent file with shared data called a module.

To create a Profile as a module

1. Create a new project.
2. In the Model Browser, right-click the root **Model** and create a new Profile.
3. Create a new Profile diagram inside the Profile.
4. Create stereotypes in the diagram.
5. Use Associations and Generalizations between them if needed.
6. In the Model Browser, from the created Profile shortcut menu, choose **Project Usages > Share Packages.**
7. Select the Profile as shared, enter its description, and click **OK**.
8. Save the project.

Now you may use this profile in other projects.

To use the created profile in other projects

- From the **File** menu, choose **Use Project** and select the project file. Only shared packages of the module will be loaded into the project.

Tip

If you don't want to see particular information, move elements from shared packages into the root model or other non-shared packages in your module.
