

# Forward compatibility

The cross-version compatibility checking mechanism is triggered when a project with new feature usages is loaded with an older version of the modeling tool. The mechanism tracks feature usages of the 2021x Refresh 1 version, which results in the appearance of a **Missing features detected** notification in earlier modeling tool versions. The following table shows tracked features and the version they appear in. Projects can be committed/saved without any consequences.

Feature name	Version
<a href="#">Contextual Relationships in Derived Properties</a>	2021x Refresh 1
<a href="#">Contextual Relationships in Generic Tables</a>	2021x Refresh 1
<a href="#">Frozen Smart Packages</a>	2021x Refresh 1

## Compatibility of profiles

While the tool is backward compatible, we highly recommend for every user working on a particular project to use the same version of the tool. For example, if you use an older version of the tool and open a project created with a later version, a balloon notification pops up:

To avoid this:

- Make sure that every user working on the same project uses the same version of the tool.
- Do not migrate profiles unless every user working on the same project is informed and ready for migration.
