

CSV Import mapping options

Browse and locate your CSV file, then select a target package into which you wish to import, then choose

the target element type, the **Next** button becomes enabled and you can click **Next** at this point, which will cause the **Import CSV: Mapping** dialog, see figure below, to appear. The dialog includes a list of properties that you can select to map with the columns in the imported CSV file, the button to map the properties and columns, key property selection, and the button to save the mapping.

A brief explanation of this step is you define mappings between CSV file columns and target element properties, by selecting a column from the CSV file and selecting a target element property, and then

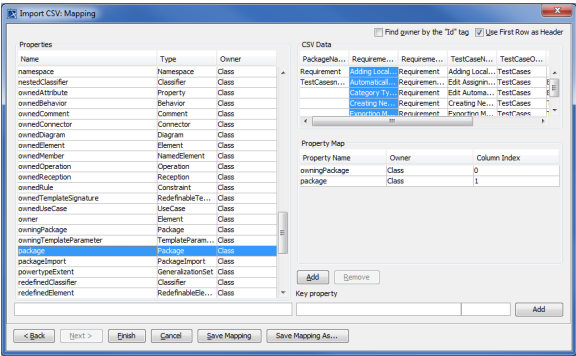

clicking the **Add** button. That CSV column will then be mapped to the selected property from the list. Repeat this step for each column until all of the preferred columns have been mapped. If you make a

mistake you can simply click the **Remove** button to remove that column and add it again. After

the mapping, you can execute the import by clicking **Finish**. Status messages will appear in your **MagicDraw Notification Window** and your **containment tree** should now be populated with the imported objects.

The table below explains the functionality of each element of the Mapping dialog.

Element	Functionality
	If this Use First Row as Header checkbox is selected, the first row of the CSV file is treated as the header row and does not get imported. The checkbox is selected by default.

☐ Find owner by the "Id" tag

By default, when we map the owner property to define the parent element, CSV Import will look up for the element by element name. There is the use case that Requirements may not have names but use ID as a unique identifier. By selecting the **Find owner by the "Id" tag** option, CSV Import will look up for elements by the ID property instead of names.

Properties

This **Properties** list shows the name, type, and owner of each property, which a target element may possess. Each property in this table is clickable. You can select a property (selected rows are highlighted) and map it to a column from the **CSV Data** table, shown on next row.

CSV Data					
DiagramN...	ClassName	Diagram	Customer...	PropertyO...	Prop
concepturl...	Customer	concepturl...	lastName	Customer	String
	Librarian	concepturl...	email	Customer	String
	Library Item	concepturl...	firstName	Customer	String
	Loan	concepturl...	ID	Customer	Long
	Loan Date	concepturl...			

The **CSV Data** table shows the CSV file contents. You can select a property from the **Properties** table and select a column from this **CSV Data** table (selected columns are highlighted), and then click

Add

to map them. You will see a row added to the **Property Map** table, shown on next row.

Property Map		
Property Name	Owner	Column Index
name	Interface	0

The **Property Map** table shows which columns from the **CSV Data** table are mapped to what property names. The column names are:

- **Property Name** refers to the property name from the **Properties** list.
- **Owner** refers to the Owner attribute, usually this is the target stereotype selected.
- **Column Index** refers to the index of the data column from the **CSV Data**. Column indices start from 0. The second column has a column index value of 1 and so on.

Key property

The **Key property** option allows you to set a unique key for the data you are importing. By selecting a row from the **Properties** table and a column from the **CSV Data** table, click

the button.

<div data-bbox="370 138 941 201">Identifier key for relation ends: <input checked="" type="radio"/> Name <input type="radio"/> Other <input type="text"/></div>	<p>Identifier key for relation ends option allows you to define the property that will be used to identify the relation ends. The Name property is selected by default, but you can use another custom property by selecting the Other radio button and typing the property name into the textbox.</p>
<div data-bbox="524 648 789 707"><div data-bbox="524 648 626 707">Add</div><div data-bbox="641 648 789 707">Remove</div></div>	<p>Clicking the <div data-bbox="1179 678 1281 724">Add</div> button will add a map between selected property in the Properties table and selected data in the CSV Data table to the Property Map table.</p> <p>Clicking the <div data-bbox="1179 1060 1326 1108">Remove</div> button remove the selected map from the Property Map table.</p>
<div data-bbox="529 1260 784 1308">Save Mapping As...</div>	<p>The Save Mapping As button allows you to save all your setting and mappings of the current import. Clicking the Save Mapping As button will bring up the dialog shown on next row.</p>

This dialog prompts you to specify the name of the current import map that you want to save.

Maps existing maps that are saved in your model.
Map Group existing map groups that are saved in your model.
