

# Useful scenarios

Three sample scenarios are exemplified to allow you to understand more how to adapt DataHub under different applicable circumstances.

- CSV files are loaded into DataHub as new tree-view Data Sources that can be saved back into the corresponding CSV files.
- The **DHLink Summary** dialog is used to preview relation types and scopes in projects to save them and generate summary reports in HTML with editable report templates.
- You want to customize attributes for specific target types, e.g., Requirements, when copying data.
