

Defining properties of the customized element to be spell checked

You can check both DSL customization classes and their properties. You can choose which properties of the [customized element](#) (Class with a «Customization» [stereotype](#)) to be spell checked.

You accomplish this by defining a customization class [tag](#) *checkSpelling* value, found in the properties tag group. By creating a value for this tag, you can choose String properties to check spelling for. By default, there are no properties marked as checkable.
