To specify a new property

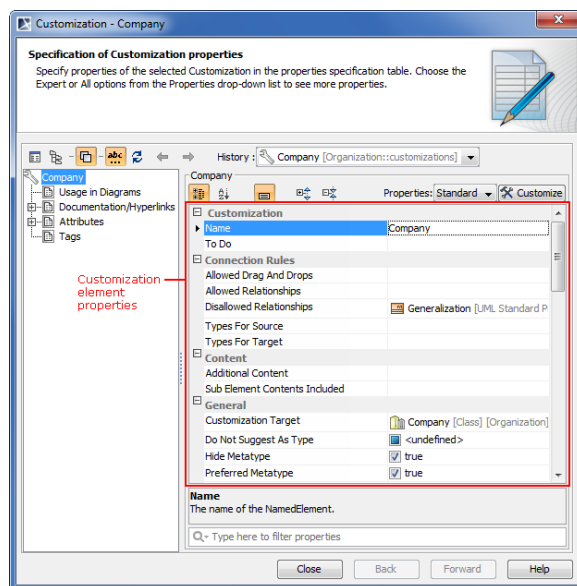

1. In a [profile diagram](#), create a customization element.
2. Open the **Customization** element Specification window.
3. In the right side of the window, select a property and modify it depending on its type.

Tip!

The properties in the **Customization** Specification window are listed in the following two locations:

1. General specification pane
2. **Tags** property group

Specify properties in either location. Changes made in the general specification pane reflect in the **Tags** property group and vice versa.
